

Clientless Cloud for Fast & Flexible Remote Connectivity

What is Teridion's overlay network?

Teridion is the only network as a service that leverages 25 public cloud providers in over 500 POPs worldwide to continuously analyze internet performance and dynamically set up the fastest internet connection for every user, wherever they are on the globe.

Unlike classic CDNs, Teridion adapts dynamically to changing internet conditions and elastically scales up and down to map real-time traffic requirements, providing high redundancy and instant network acceleration where and when you need it.

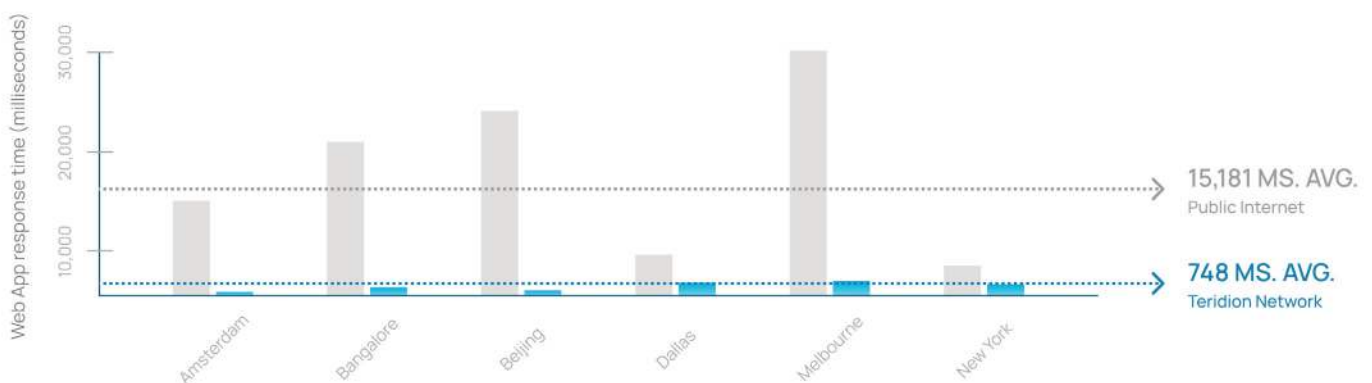

Teridion optimizes user experience for:

SaaS application performance: Deliver rich interactive applications and dynamic web content to global users without being constrained by poor internet performance.

Expanding to new geographies: Give global customers a consistent 'like-local' experience, even in difficult to serve locations like China and India.

Securing private networking: Provide an invisible, enterprise-class, secure private network, no SSL key sharing required and DDoS mitigation.

Teridion vs. Public Internet

Source: Catchpoint, time to transfer 5MB from San Jose, CA

Don't choose between performance and ease-of-use. Get both.

- Zero CAPEX and OPEX: No hardware to purchase, no software to download.
- Plug and play: No need for any devices, apps, or configuration on user side
- Quick setup: Basic and very minimal setup on the corporate admin side; Deploys in minutes.
- Scalable and flexible: Supports changing traffic needs and unlimited users. DNS-based, inter-operable with every VPN.
- Enterprise-class security and privacy: Doesn't require SSL keys. Supports data sovereignty and DDoS mitigation.

About Us

In a world where network resilience is increasingly complex, Teridion's AI-powered Network as a Service makes end-to-end connectivity unbelievably simple. Telcos and technology partners like Deutsche Telekom, Zscaler, and Barracuda trust Teridion to easily bypass ANY connectivity challenge, from latency to full-blown outage. That's because it is the only WAN with a global backbone that spans 25 public cloud providers in over 500 global PoPs to always find the optimal path between any two points on the internet. And it deploys in less than 24 hours. Just switch on Teridion to get a high-performance network with zero downtime, headaches, or middle-of-the-night phone calls to your IT team
